

Develop an elementary chatbot for suitable customer interaction application in AI.

Code :-

```
while True :  
    user = input("User :").lower()  
    if user in["hii","hello"]:  
        print("Bot : Hello There ! How can i assist you today.")  
    elif "help me" in user:  
        print("Bot: yes sure..")  
    elif "bye" in user:  
        print("Bot : Bye Have a good day")  
  
    break  
else:  
    print("Bot : Sorry i didn't found")
```

Theory :-

 Aim

To develop a simple chatbot that interacts with users and responds to basic queries.

 Theory

A chatbot is a program that simulates human conversation.

This elementary chatbot uses rule-based logic (if-else conditions) to respond to user input.

It checks keywords in user messages and gives predefined responses. It is simple, fast, and suitable for basic customer interaction.

 Algorithm Steps

- 1. Start**
- 2. Display welcome message**
- 3. Take user input**
- 4. Convert input to lowercase**
- 5. Check input using conditions:**
 - **If user says "hello" → reply greeting**
 - **If user asks about "price" → give price info**
 - **If user says "bye" → exit**
- 6. Repeat until user exits**
- 7. Stop**
